

Lab 6:

Objective

To design and implement cart feature in an E-commerce site.

Theory

Once an auction closes, the winning bidder needs a way to view and manage the items they have won, similar to how an e-commerce cart displays a user's purchases. In this system, a "My Wins" page was built to serve this purpose, using the winner_id field that is already recorded on the items table when an auction automatically closes.

Rather than creating a separate cart table, the system queries the items table directly for all records where the winner_id matches the currently logged-in user. Each won item's price is retrieved and summed together using a PHP loop to calculate a grand total, similar to how a shopping cart displays a total cost across multiple products. To make the page function more like a real checkout flow, a payment_status column was added to the items table, allowing each won item to be marked as either pending or paid. Users can click a "Mark as Paid" button next to any pending item, which updates its payment status in the database, giving the page a simple order-completion workflow.

Source Code:

a) Fetching Won Items and Calculating Total:

```
$winsQuery = $pdo->prepare(
    "SELECT items.*, users.full_name AS seller_name
    FROM items
    JOIN users ON items.seller_id = users.id
    WHERE items.winner_id = :user_id
    ORDER BY items.end_time DESC"
);
$winsQuery->execute([':user_id' => $_SESSION['user_id']]);
$wonItems = $winsQuery->fetchAll();

$total = 0;
foreach ($wonItems as $wonItem) {
    $total += (float) $wonItem['current_price'];
}
```

b) Marking items as paid:

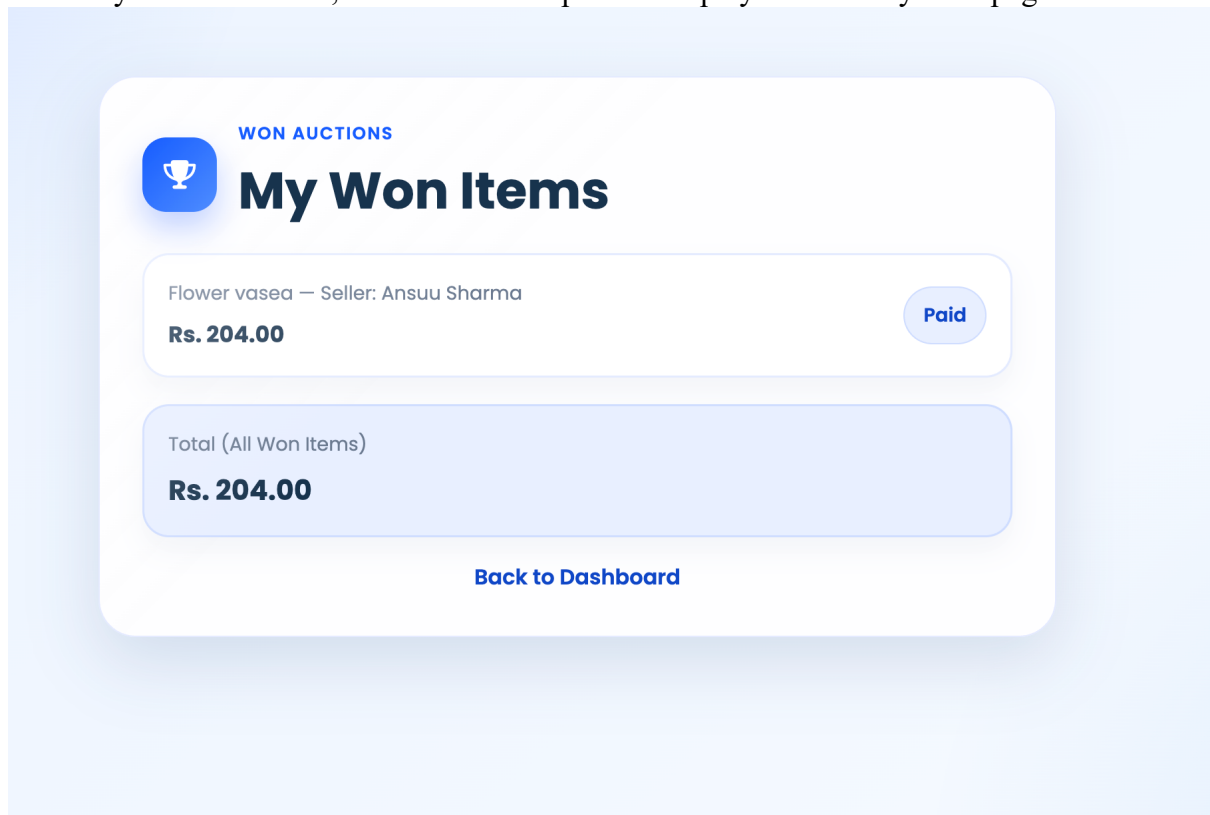

```
if ($_SERVER['REQUEST_METHOD'] === 'POST' &&
isset($_POST['mark_paid'])) {
    $itemId = (int) ($_POST['item_id'] ?? 0);

    $update = $pdo->prepare(
        "UPDATE items SET payment_status = 'paid' WHERE id = :id AND winner_id
        = :winner_id"
    );
    $update->execute([
        ':id' => $itemId,
        ':winner_id' => $_SESSION['user_id'],
    ]);}
```

Output

Wishlist button:

After any user wins a bid, the item with its price is displayed in the my wins page

Conclusion

The "My Wins" feature was successfully implemented to give users a centralized view of the auctions they have won, functioning similarly to a cart or order history page. By reusing the existing `winner_id` field set during auction auto-closing, the system avoided unnecessary duplication of data across tables. The addition of a `payment_status` column and a "Mark as Paid" action allows the page to simulate a basic checkout process, reinforcing the practical connection between the bidding logic built earlier and a complete post-auction workflow.
